

Machine Learning HW6 - support vector machine

library

scikit learn

PCA

SVM (C-SVC)

GridSearchCV

pyplot

What I have done?

First, I try using `sklearn.svm.SVC()` with no argument.

panalty parameter C: 1.0

kernel: rbf

gamma: $1/n_{\text{feature}}$ And have a not bad score 95.32% accuracy!

By default, parameters are:

```
In [4]: model = svm.SVC()
        model.fit(X_train_np, T_train_np)

Out[4]: SVC(C=1.0, cache_size=200, class_weight=None, coef0=0.0,
            decision_function_shape='ovr', degree=3, gamma='auto', kernel='rbf',
            max_iter=-1, probability=False, random_state=None, shrinking=True,
            tol=0.001, verbose=False)

In [7]: model.score(X_test, T_test)

Out[7]: 0.9532000000000005
```

Use grid search `sklearn.model_selection.GridSearchCV()` to find best parameters

Visualize the result by using PCA to project data onto 2D space

Take me so much time waiting...

```
In [*]: model_cv = GridSearchCV(svm.SVC(), param_grid, cv=5)
        model_cv.fit(X_train_np, T_train_np)

In [24]: model_cv.best_params_

Out[24]: {'C': 2.0, 'gamma': 0.0004, 'kernel': 'rbf'}
```

`pca_2d = PCA(n_components=2, copy=True)` `X_train_2d =`

`pca_2d.fit_transform(X_train_np)` `x_2d, y_2d = zip(*X_train_2d)`

Scatter data points (use cross marker to identify support vectors)

`plt.scatter(x_2d, y_2d, color=colors, marker='.')` `plt.scatter(x_SVs_2d, y_SVs_2d,`
`color=color_SVs, marker='x', s=size)`

Use Voronoi diagram generated from 1-nearest neighbor as visualization of decision

```

boundary
resolution = 100 # 100x100 background pixels X2d_xmin, X2d_xmax =
np.min(X_train_2d[:,0]), np.max(X_train_2d[:,0]) X2d_ymin, X2d_ymax =
np.min(X_train_2d[:,1]), np.max(X_train_2d[:,1]) xx, yy =
np.meshgrid(np.linspace(X2d_xmin, X2d_xmax, resolution), np.linspace(X2d_ymin,
X2d_ymax, resolution)) # approximate Voronoi tessellation on resolution x resolution
grid using 1-NN background_model =
KNeighborsClassifier(n_neighbors=1).fit(X_train_2d, T_train_predict)
voronoiBackground = background_model.predict(np.c_[xx.ravel(), yy.ravel()])
voronoiBackground = voronoiBackground.reshape((resolution, resolution))
Visualization result

```

What I have learned?

There is library tools that can do grid search, I no longer need to brute-forcelly write loop to try all parameters.

Effect in different hyper-parameter such as panalty C and gamma used for rbf kernel

First time use 3D plot!

Something else

Projecting to 3D space is easier to observe support vectors

ICA compare to PCA
